**DETAILED ACTION**

**Reason For Allowance**

1. Claims 1-20 are allowed.
2. Following is an examiner's statement of reasons for allowance:

The prior art taken either singularly or in combination fails to anticipate or fairly suggest the limitations of the independent claim(s), in such a manner that a rejection under 35 U.S.C. 102 or 103 would be proper. The prior art fails to teach a combination of all the claimed features as presented in independent claims 1, 8 and 14, which include (claim1 and 14) electric dipoles in the rotatable micro-mirrors; at least two sets of opposing rung electrodes which interlace orthogonally, and crisscross each other; the rung electrodes electrically connected to at least two of the bus bars for electric field group coupling to the induced electric dipoles; and microprocessor mean for selectively addressing each pair of the bus bars; (claim 8) method for selectively inducing an electric dipole in each of the rotatable minimirrors; producing a grid array of independently orientable electric fields for coupling to the induced electric dipoles by means of sets of orthogonally crisscrossing opposing rung electrodes; and selectively aligning at least one of the rotatable mini-mirrors by means of the electric fields.

3. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

**Conclusion**

Art Unit: 2873

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Davidson et al. (US Patent 6,612,705 B1) discloses a minioptic solar energy concentrator in Figure 9 comprising of mirror-embedded balls (2), a surrounding medium (18), a electric means for aligning the mirrors; however, Davidson et al. does not teach or suggest electric dipoles in the rotatable micro-mirrors; at least two sets of opposing rung electrodes which interlace orthogonally, and crisscross each other; the rung electrodes electrically connected to at least two of the bus bars for electric field group coupling to the induced electric dipoles; and microprocessor mean for selectively addressing each pair of the bus bars or method thereof.
